

ELLIOTT'S LOVEGRASS *Eragrostis elliottii*

When Elliott's Lovegrass reaches its bloom height in late summer (see below) it gives the appearance of a misty ground fog covering the ground, especially when observed in masses of a dozen plants or more. To achieve an effective mass, plant one gallon plants 30" on center.....the effect is ethereal. Rarely do the plants get taller than 18 inches and are generally well-behaved. Cut back the entire plant to six inches in the fall or once the seed heads start to blow around like tumbleweed. They even look good with crew-cuts.
